

AyurEze Patient App - Complete User Journey

End-to-End Flow: App Open to App Close (Astra AI Integration)

1. App Initialization & Authentication

- A. Splash Screen:** App opens, verifies device security and internet connection.
- B. Login / Auto-Login:** User logs in via OTP/Biometrics. Flutter securely stores the Auth Token.
- C. Identity Sync:** The app fetches the user's Profile ID from the legacy MySQL database and quietly authenticates with the Astra Supabase ecosystem.

2. The Super App Dashboard

- A. Landing Page:** User lands on the traditional Home Screen (showing categories like Food, Therapy, Instamart).
- B. The UI Toggle:** A prominent floating button or TabBar (similar to Swiggy) allows the user to switch instantly from 'Traditional Shopping' to 'Astra AI Companion'.

3. The Astra AI Chat Flow (The Core Journey)

- A. Initialization:** User switches to Astra AI. Astra greets the user by name, referencing past health history if available.
- B. Symptom Capture:** User types or uses voice-to-text to describe their symptoms (e.g., 'I have a severe headache and fever').
- C. AI Triage:** Astra securely processes the input. Under the hood, symptoms are symmetrically encrypted (DISHA compliance) and saved to the decentralized vault.
- D. AI Resolution:** Astra provides a wellness plan, lifestyle advice, and recommends specific AyurEze herbal medicines.

4. Prescription & E-Commerce Flow

- A. Automated Cart:** The Astra backend automatically communicates with the Shopify API to create a Draft Order containing the prescribed medicines.
- B. Rich UI Card:** Astra sends a 'Smart Card' in the chat UI containing the cart summary and a 'Pay Now' button.
- C. Native Checkout:** User taps 'Pay Now'. The Flutter app triggers the native Razorpay SDK overlay.
- D. Payment Success:** Once Razorpay succeeds, Flutter notifies Astra. Astra marks the Shopify order as 'Paid' and updates the legacy MySQL wallet interlink.

5. Post-Consultation & App Close

A. Order Tracking: Astra provides a tracking link for the newly purchased medicines.

B. Secure Audit Log: The backend finalizes the immutable audit log for the session, ensuring medical liability compliance.

C. App Close: The user closes the app. All sensitive session data is cleared from the device's volatile memory, remaining safely encrypted in the Astra ecosystem.
